Cichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                             1 GAGAACAACAAGATTCG 17

//clone lib="Bimeria tenella M5-6 Excised Synthesis cDNA
and excysted occysts of E.tenella grown in chickens. cDNA
was synthesized from poly mRNA using an oligo-dT primer
containing a XhoI site. Following second strand synthesis,
ECORI Adapters were ligated to the CDNA and products were
size-selected on sephacryl S500. The CDNA were ligated to
ECORI/XhoI prepared lambda ZapII (Stratagene). The primary
library was mass excised using ExAssist helper phage
(Stratagene). The phagemids were preciptated with PEG
8000, extracted with phenol/Chloroform and electroporated
into DH10B cells. The library may contain a small
percentage of host or bacterial contaminants. Library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (<a href="http://depts.washington.edu/ventures/collabtr/direct/index.htm>#b rt). Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<a href="http://www.tigr.org/softlab/">http://www.tigr.org/softlab/</a>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR PRimers

Based upon the presence of a XhoI site followed by a run of 14 or
more T residues at the beginning of the sequence, this clone was
polyadenylated. The resulting Poly-T sequence has been removed. hit

/clone_lib="QH_EFGHJ sunflower RHA280"
/note="Vector: pBRcDNA5fiAB; The library was constructed from 11 different sources of RNA from a single genotype.
Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/
                                                                                                                                                                                                                                                           /db_xref="taxon:4232"

/clone="Vector: pBRcDNASfiAB; The library was constructed /nore="Vector: pBRcDNASfiAB; The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_SBQ=Not found"

//clone lib="QH ABCDI sunflower RHA801"
//clone lib="QBCDNASfiAB; The library was constructed from 11 different sources of RNA from a single genotype.
Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_TISSUE=shoots environmental stress

/note="Vector: pBRcDNASflAB; The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_ILB-QH_EFGHJ sunflower RHA280

//clone "Wester: pBRcDNASfLAB; The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_TISUE=shoots environmental stress

Anther meiotic stage was determined by removing anthers from individual primary florets. One anther was sacrificed for microscopic staging, and if determined to be between (and including) meiotic stages pre-meiosis and metaphase I, the remaining two anthers were collected and pooled for library construction. The tissue, total RNA, and poly(A) RNA were prepared, cDNA synthesised, and directionally ligated into pSPORTI by Tim Sutton in the P Langridge Lab at the Department of Plant Science, University of Adelaide, Waite Campus, Australia. Average insert size 1.5Kb. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

/note="Vector: pZero-2 (Invitrogen); Site 1: EcoRV;
Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size distribution of 1-1.5kb fragments, blunt-ended with T4 DNA polymerase, dephosphorylated with Shrimp Alkaline Phosphatase and ligated into pZero-2 vector's EcoRV site."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /clone lib="1119 - RescueMu Grid AA"
/note="Torgan: leaf; Vector: RescueMu (engineered from /note="Torgan: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHI; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

/note="Torgan: pooled; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized tibraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-303087, 682632-687239, 726408-728711, and 729086-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

a modified polylinker; Site_1: Not I; Site_2: Ecc RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI_CGAP_GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-687239,
726408-728711, and 729096-731399. Subtraction by Bento
Soares and M. Fatima Bonaldo. "

/clone_lib="Avicennia marina leaf cDNA Library"
/note="A one-year-old plant from the natural mangrove
habitat in Pichavaram, Tamil Nadu, India was collected
and brought to the M.S.waminatan Research Foundation.
The whole plant was treated with the nutrient solution
supplemented with 500 mM NaCl for 48 hours. Poly(A+)mRNA
from the leaf tissue was purified and cDNA was prepared
using Superscript Lambda System (Life Technologies, Cat.
No. 19643-014). The cDNAs were size fractionated over
SizeSep-400 spun column (Amersham-Pharmacia Biotech Cat
No. 27-5105-01) and cloned in 5'Sal I - 3' Not I of
psPORT1 (Life Technologies Cat. No. 15383-011). The ESTs
were sequenced from the 5' end using M1)FUCLS reverse
primer in an Automated Sequencer (ABI310, Applied
Biosystems) and submitted after editing to remove the
vector and adapter sequences. BLAST search in BLASTX
(Non-redundant) was carried out on 7th August, 2000 using
default parameters and the results reported under

cDNA Library Arrayed by: Greg Lennon, Ph.D.

DNA Sequencing by: Washington University Genome Sequencing Center
Clone distribution: NCI-CGAP clone distribution information can be
found through the I.M.A.G.E. Consortium/LLNL at:
www-bio.llnl.gov/bbrp/image/image.tml
Insert Length: 1302 Std Error: 0.00
Seq primer: -40m13 fwd. ET from Amersham.
Location/Qualifiers
]. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT773 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo."
